

Practice 4. Interfaces and Abstract Classes (2 pts)

Task

Create classes and an interface to model a simple system where different objects can receive pizza in a restaurant. Your program must include the following elements: Animal, Person, Cat, Student, Restaurant, and an interface CanHavePizza

Objects that are able to receive pizza should implement the appropriate behavior defined by the interface. Class Restaurant must contain a method that serves pizza to an object capable of having pizza.

In your test program:

- create several objects of different classes,
- demonstrate how the restaurant serves pizza to them.

You may add fields, methods, and relationships between classes where appropriate.
